

Defuse or Die Trying

A physical, real-time bomb-defusal game built for teamwork, pressure, and split-second decisions — no screens, no spectating, just survival.

TEAM NAME: CHAOS PROTOCOL

Dhruv Singh (56)

Poorab Valecha (63)

Yoshita Vishwakarma (66)

Vansh Lalwani (33)

The Problem

Passive Experiences

Most interactive games rely on screens and controllers — spectators, not players.

No Real Stakes

Digital games lack the physical tension needed to simulate true decision-making under pressure.

Weak Teamwork Loop

Multi-player dominated. Collaborative, high-stakes coordination is rare in embedded game design.

How It Works

Every mistake shortens the clock. Solve all modules before time hits zero — or it's over.

Raspberry Pi Pico

Central controller managing all modules in a non-blocking loop.

LCD Countdown Timer

Live timer display — pressure mounts with every second lost.

Escalating Buzzer

Audio urgency increases as the clock winds down.

Multi-Module Puzzles

Wire cutting, button combos, and gas sensing — all must be solved.

What Makes It Unique

Physical-First Design

A digital concept — fully realized in hardware. Real wires. Real tension.

Randomized Puzzles

Controlled random generation ensures no two games play the same way.

Sensor-Driven Gameplay

Gas detection, button logic, and wire states feed live game mechanics.

Non-Blocking Embedded OS

Smooth multitasking with no delays — all modules run in parallel.

Defuse. Collaborate. Survive.

An immersive, real-world experience that merges electronics, design, and human pressure into one unforgettable game.

⚡ Electronics

Raspberry Pi Pico + sensors

🤝 Teamwork

Collaboration under the clock

🎮 Interaction

Physical puzzles, real stakes
